

## VB-MAPP Reliability Check Form

### Procedure:

1. Pre-select 3 items per domain. The three items should be selected from the range of items that are likely to be acquired or close to acquired for the student's to be observed. Avoid selecting items that are way beyond what you estimate to be the student's competency level.
2. Simultaneously score the selected the items with the site classroom VB-MAPP administrator. During this process, either the VB consultant or the Local VB-MAPP administrator can administer the items to the student. Be sure, however, that both individual evaluators are not able to determine how each has scored the selected reliability items.
3. Upon completion of the reliability items, enter scores from both evaluators on this score sheet.
4. Calculate agreement by the formula presented on the last line of this chart. Agreement needs to be at 90% or higher. If lower levels of agreement are found, check scoring criteria, discuss, re-train as necessary and then re-check reliability by repeating this process.
